# 1. Introduction

ILI9325 is a 262,144-color one-chip SoC driver for a-TFT liquid crystal display with resolution of 240RGBx320 dots, comprising a 720-channel source driver, a 320-channel gate driver, 172,800 bytes RAM for graphic data of 240RGBx320 dots, and power supply circuit.

The dithering image processing is implemented in ILI9325 to provide the 16 million colors display quality and the Multi-domain Vertical Alignment (MVA) wide view angle display is also supported in the ILI9325.

ILI9325 has four kinds of system interfaces which are i80-system MPU interface (8-/9-/16-/18-bit bus width), VSYNC interface (system interface + VSYNC, internal clock, DB[17:0]), serial data transfer interface (SPI) and RGB 6-/16-/18-bit interface (DOTCLK, VSYNC, HSYNC, ENABLE, DB[17:0]).

In RGB interface and VSYNC interface mode, the combined use of high-speed RAM write function and widow address function enables to display a moving picture at a position specified by a user and still pictures in other areas on the screen simultaneously, which makes it possible to transfer display the refresh data only to minimize data transfers and power consumption.

ILI9325 can operate with 1.65V I/O interface voltage, and an incorporated voltage follower circuit to generate voltage levels for driving an LCD. The ILI9325 also supports a function to display in 8 colors and a sleep mode, allowing for precise power control by software and these features make the ILI9325 an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, PDA and PMP where long battery life is a major concern.

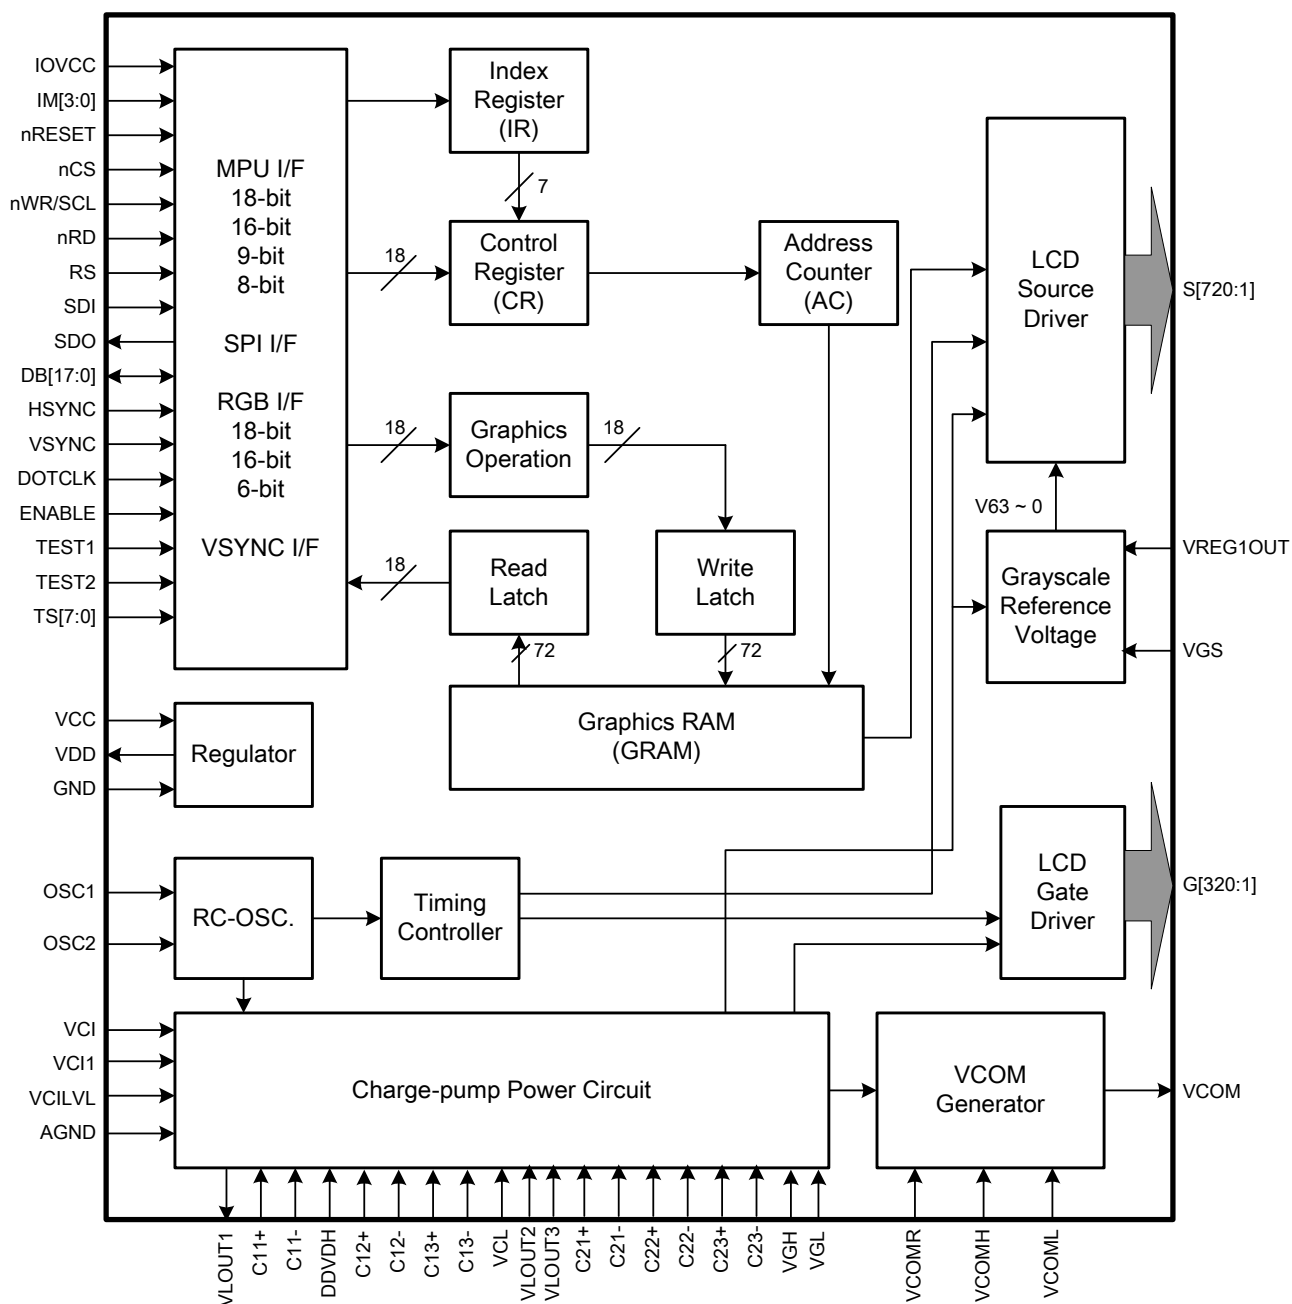

# 2. Features

- ◆ Single chip solution for a liquid crystal QVGA TFT LCD display
- ◆ 240RGBx320-dot resolution capable with real 262,144 display color
- ◆ Dithering image processing implemented to provide 16.7-million color display quality
- ◆ Support MVA (Multi-domain Vertical Alignment) wide view display
- ◆ Incorporate 720-channel source driver and 320-channel gate driver
- ◆ Internal 172,800 bytes graphic RAM
- ◆ High-speed RAM burst write function
- ◆ System interfaces
  - i80 system interface with 8-/ 9-/16-/18-bit bus width
  - Serial Peripheral Interface (SPI)
  - RGB interface with 6-/16-/18-bit bus width (VSYNC, HSYNC, DOTCLK, ENABLE, DB[17:0])
  - VSYNC interface (System interface + VSYNC)
- ◆ n-line liquid crystal AC drive: invert polarity at an interval of arbitrarily n lines (n: 1 ~ 64)
- ◆ Internal oscillator and hardware reset
- ◆ Resizing function (×1/2, ×1/4)
- ◆ Reversible source/gate driver shift direction

- ◆ Window address function to specify a rectangular area for internal GRAM access
- ◆ Bit operation function for facilitating graphics data processing
  - Bit-unit write data mask function
  - Pixel-unit logical/conditional write function
- ◆ Abundant functions for color display control
  - $\gamma$ -correction function enabling display in 262,144 colors
  - Line-unit vertical scrolling function
- ◆ Partial drive function, enabling partially driving an LCD panel at positions specified by user
- ◆ Incorporate step-up circuits for stepping up a liquid crystal drive voltage level up to 6 times (x6)
- ◆ Power saving functions
  - 8-color mode
  - standby mode
  - sleep mode
- ◆ Low -power consumption architecture
  - Low operating power supplies:
    - $IOV_{cc} = 1.65V \sim 3.3V$  (interface I/O)
    - $V_{cc} = 2.4V \sim 3.3V$  (internal logic)
    - $V_{ci} = 2.5V \sim 3.3V$  (analog)
- ◆ LCD Voltage drive:
  - Source/VCOM power supply voltage
    - $DVDH - GND = 4.5V \sim 6.0$
    - $VCL - GND = -2.0V \sim -3.0V$
    - $VCI - VCL \leq 6.0V$
  - Gate driver output voltage
    - $VGH - GND = 10V \sim 20V$
    - $VGL - GND = -5V \sim -15V$
    - $VGH - VGL \leq 32V$
  - VCOM driver output voltage
    - $VCOMH = 3.0V \sim (DDVDH-0.5)V$
    - $VCOML = (VCL+0.5)V \sim 0V$
    - $VCOMH-VCOML \leq 6.0V$
- ◆ a-TFT LCD storage capacitor: Cst only

When the serial peripheral interface is selected, IM0 pin is used for the device code ID setting.																																																																											
nCS	I	MPU IOVcc	A chip select signal. Low: the ILI9325 is selected and accessible High: the ILI9325 is not selected and not accessible Fix to the DGND level when not in use.																																																																								
RS	I	MPU IOVcc	A register select signal. Low: select an index or status register High: select a control register Fix to either IOVcc or DGND level when not in use.																																																																								
nWR/SCL	I	MPU IOVcc	A write strobe signal and enables an operation to write data when the signal is low. Fix to either IOVcc or DGND level when not in use.  SPI Mode: Synchronizing clock signal in SPI mode.																																																																								
nRD	I	MPU IOVcc	A read strobe signal and enables an operation to read out data when the signal is low. Fix to either IOVcc or DGND level when not in use.																																																																								
nRESET	I	MPU IOVcc	A reset pin. Initializes the ILI9325 with a low input. Be sure to execute a power-on reset after supplying power.																																																																								
SDI	I	MPU IOVcc	SPI interface input pin. The data is latched on the rising edge of the SCL signal.																																																																								
SDO	O	MPU IOVcc	SPI interface output pin. The data is outputted on the falling edge of the SCL signal. Let SDO as floating when not used.																																																																								
DB[17:0]	I/O	MPU IOVcc	An 18-bit parallel bi-directional data bus for MPU system interface mode 8-bit I/F: DB[17:10] is used. 9-bit I/F: DB[17:9] is used. 16-bit I/F: DB[17:10] and DB[8:1] is used. 18-bit I/F: DB[17:0] is used.  18-bit parallel bi-directional data bus for RGB interface operation 6-bit RGB I/F: DB[17:12] are used. 16-bit RGB I/F: DB[17:13] and DB[11:1] are used.																																																																								

Pin Name	I/O	Type	Descriptions
			18-bit RGB I/F: DB[17:0] are used.  Unused pins must be fixed either IOVcc or DGND level.
ENABLE	I	MPU IOVcc	Data ENEABLE signal for RGB interface operation. Low: Select (access enabled) High: Not select (access inhibited) The EPL bit inverts the polarity of the ENABLE signal.  Fix to either IOVcc or DGND level when not in use.
DOTCLK	I	MPU IOVcc	Dot clock signal for RGB interface operation. DPL = "0": Input data on the rising edge of DOTCLK DPL = "1": Input data on the falling edge of DOTCLK Fix to the IOVcc level when not in use
VSYNC	I	MPU IOVcc	Frame synchronizing signal for RGB interface operation. VSPL = "0": Active low. VSPL = "1": Active high. Fix to the IOVcc level when not in use.
HSYNC	I	MPU IOVcc	Line synchronizing signal for RGB interface operation. HSPL = "0": Active low. HSPL = "1": Active high. Fix to the IOVcc level when not in use
FMARK	O	MPU IOVcc	Output a frame head pulse signal. The FMARK signal is used when writing RAM data in synchronization with frame. Leave the pin open when not in use.
OSC1 OSC2	I O	Oscillation resistor	Connect an external resistor for generating internal clock by internal R-C oscillation, or an external clock signal is supplied through OSC1.
<b>LCD Driving signals</b>			
S720~S1	O	LCD	Source output voltage signals applied to liquid crystal. To change the shift direction of signal outputs, use the SS bit. SS = "0", the data in the RAM address "h00000" is output from S1. SS = "1", the data in the RAM address "h00000" is output from S720. S1, S4, S7, ... display red (R), S2, S5, S8, ... display green (G), and S3, S6, S9, ... display blue (B) (SS = 0).
G320~G1	O	LCD	Gate line output signals. VGH: the level selecting gate lines VGL: the level not selecting gate lines
VCOM	O	TFT common electrode	A supply voltage to the common electrode of TFT panel. VCOM is AC voltage alternating signal between the VCOMH and VCOML levels.
VCOMH	O	Stabilizing capacitor	The high level of VCOM AC voltage. Connect to a stabilizing capacitor.
VCOML	O	Stabilizing capacitor	The low level of VCOM AC voltage. Adjust the VCOML level with the VDV bits. Connect to a stabilizing capacitor.
VCOMR	I	Variable resistor or open	A reference level to generate the VCOMH level either with an externally connected variable resistor or by setting the register of the ILI9325. When using a variable resistor, halt the internal VCOMH adjusting circuit by setting the register and place the resistor between VREG1OUT and AGND. When generating the VCOMH level by setting the register, leave this pin open.
VGS	I	AGND or external resistor	Reference level for the grayscale voltage generating circuit. The VGS level can be changed by connecting to an external resistor.
<b>Charge-pump and Regulator Circuit</b>			
Vci	I	Power supply	A supply voltage to the analog circuit. Connect to an external power supply of 2.5 ~ 3.3V.
AGND	I	Power	AGND for the analog side: AGND = 0V. In case of COG, connect to

Pin Name	I/O	Type	Descriptions
		supply	GND on the FPC to prevent noise.
VciLVL	I	Power supply	VciLVL must be at the same voltage level as Vci. VciLVL=2.5V ~ 3.3V. Connect to the external power supply. In COG case, connect the VciLVL with Vci on the FPC to prevent noise.
VciOUT	O	Stabilizing capacitor Vci1	An internal reference voltage generated between Vci and AGND. The amplitude between Vci and DGND is determined by the VC[2:0] bits.
Vci1	I	Stabilizing capacitor Vci1	An internal reference voltage for the step-up circuit1. The amplitude between Vci and DGND is determined by the VC[2:0] bits. Make sure to set the Vci1 voltage so that the VLOUT1, VLOUT2 and VLOUT3 voltages are set within the respective specification.
VLOUT1	O	Stabilizing capacitor, DDVDH	Output voltage from the step-up circuit 1, which is generated from Vci1. The step-up factor is set by "BT" bits. VLOUT1= 4.5 ~ 6.0V Place a stabilizing capacitor between AGND.
DDVDH	O	VLOUT1	Power supply for the source driver and Vcom drive. Connect to VLOUT1 and DDVDH = 4.5 ~ 6.0V
VLOUT2	O	Stabilizing capacitor, VGH	Output voltage from the step-up circuit 2, which is generated from Vci1 and DDVDH. The step-up factor is set by "BT" bits. VLOUT2= max.15V Place a stabilizing capacitor between AGND and a shottkey diode between Vci.
VGH	I	VLOUT2	Power supply for the gate driver, connect to VLOUT2.
VLOUT3	O	Stabilizing capacitor, VGL	Output voltage from the step-up circuit 2, which is generated from Vci1 and DDVDH. The step-up factor is set by "BT" bits. VLOUT3= max. -12.5V Place a stabilizing capacitor between AGND and a shottkey diode between Vci.
VGL	I	VLOUT3	Power supply for the gate driver, connect to VLOUT3.
VCL	O	Stabilizing capacitor, VCL	VcomL driver power supply. VCLC = 0 ~ -3.3V. Place a stabilizing capacitor between AGND
C11+, C11- C12+, C12-	I/O	Step-up capacitor	Capacitor connection pins for the step-up circuit 1.
C13+, C13- C21+, C21- C22+, C22- C23+, C23-	I/O	Step-up capacitor	Capacitor connection pins for the step-up circuit 2.
VREG1OUT	I/O	Stabilizing capacitor or power supply	Output voltage generated from the reference voltage.  The voltage level is set with the VRH bits. VREG1OUT is (1) a source driver grayscale reference voltage, (2) VcomH level reference voltage, and (3) Vcom amplitude reference voltage. Connect to a stabilizing capacitor. VREG1OUT = 3.0 ~ (DDVDH - 0.5)V.
<b>Power Pads</b>			
Vcc	I	Power supply	A supply voltage to the internal logic: Vcc = 2.4~3.3V
IOVcc	I	Power supply	A supply voltage to the interface pins: IM[3:0], nRESET, nCS, nWR, nRD, RS, DB[17:0], VSYNC, HSYNC, DOTCLK, ENABLE, SCL, SDI, SDO. IOVcc = 1.65 ~ 3.3V and Vcc ≥ IOVcc. In case of COG, connect to Vcc on the FPC if IOVcc=Vcc, to prevent noise.
VDD	O	Power	Digital core power pad.

Pin Name	I/O	Type	Descriptions
			Connect them with the 1uF capacitor.
GND	I	Power supply	DGND for the logic side: DGND = 0V.
IOGND	I	Power supply	IOGND for the interface pins. IOGND = 0V. In case of COG, connect to GND on the FPC to prevent noise.
<b>Test Pads</b>			
V0T, V31T	-	-	Dummy pads. Connect to IOVcc, GND or leave these pins as open.
VTEST	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
VREFC	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
VREF	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
VDDTEST	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
VREFD	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
VMON	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
TESTA5	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
IOVCCDUM1~2	O	Power	Output the IOVcc voltage level. These pins are internally shorted to IOVCC
VCCDUM1	-	-	Dummy pin. Connect to IOVcc, GND or leave this pin as open.
IOGNDDUM1~3	O	Power	Output the GND voltage level. These pins are internally shorted to GND. When adjacent pins are needed to pull low, tie these pins to IOGNDDUM1~3.
OSC1DUM1~4	-	-	Dummy pads. Connect to IOVcc, GND or leave these pins as open.
OSC2DUM1~2	-	-	Dummy pads. Connect to IOVcc, GND or leave these pins as open.
AGNDDUM1	-	-	Dummy pad. Connect to IOVcc, GND or leave this pin as open.
AGNDDUM2~4	O	Power	Output the GND voltage level. These pins are internally shorted to GND.
DUMMYR1~ 10	-	-	Dummy pads.
VGLDMY1~4	O	Open	Dummy pads. Connect to IOVcc, GND or leave these pins as open.

### MPU System Interface

ILI9325 supports three system high-speed interfaces: i80-system high-speed interfaces to 8-, 9-, 16-, 18-bit parallel ports and serial peripheral interface (SPI). The interface mode is selected by setting the IM[3:0] pins.

ILI9325 has a 16-bit index register (IR), an 18-bit write-data register (WDR), and an 18-bit read-data register (RDR). The IR is the register to store index information from control registers and the internal GRAM. The WDR is the register to temporarily store data to be written to control registers and the internal GRAM. The RDR is the register to temporarily store data read from the GRAM. Data from the MPU to be written to the internal GRAM are first written to the WDR and then automatically written to the internal GRAM in internal operation. Data are read via the RDR from the internal GRAM. Therefore, invalid data are read out to the data bus when the ILI9325 read the first data from the internal GRAM. Valid data are read out after the ILI9325 performs the second read operation.

Registers are written consecutively as the register execution time except starting oscillator takes 0 clock cycle.

### Parallel RGB Interface

ILI9325 supports the RGB interface and the VSYNC interface as the external interface for displaying a moving picture. When the RGB interface is selected, display operations are synchronized with externally supplied signals, VSYNC, HSYNC, and DOTCLK. In RGB interface mode, data (DB17-0) are written in synchronization with these signals according to the polarity of enable signal (ENABLE) to prevent flicker on display while updating display data.

In VSYNC interface mode, the display operation is synchronized with the internal clock except frame synchronization, where the operation is synchronized with the VSYNC signal. Display data are written to the internal GRAM via the system interface. In this case, there are constraints in speed and method in writing data to the internal RAM. For details, see the "External Display Interface" section. The ILI9325 allows for switching between the external display interface and the system interface by instruction so that the optimum interface is

selected for the kind of picture to be displayed on the screen (still and/or moving picture(s)). The RGB interface, by writing all display data to the internal RAM, allows for transferring data only when updating the frames of a moving picture, contributing to low power requirement for moving picture display.

## **Bit Operation**

The ILI9325 supports a write data mask function for selectively writing data to the internal RAM in units of bits and a logical/compare operation to write data to the GRAM only when a condition is met as a result of comparing the data and the compare register bits. For details, see “Graphics Operation Functions”.

## **Address Counter (AC)**

The address counter (AC) gives an address to the internal GRAM. When the index of the register for setting a RAM address in the AC is written to the IR, the address information is sent from the IR to the AC. As writing data to the internal GRAM, the address in the AC is automatically updated plus or minus 1. The window address function enables writing data only in the rectangular area arbitrarily set by users on the GRAM.

## **Graphics RAM (GRAM)**

GRAM is graphics RAM storing bit-pattern data of 172,820 (240 x 320x 18/8) bytes with 18 bits per pixel.

## **Grayscale Voltage Generating Circuit**

The grayscale voltage generating circuit generates a liquid crystal drive voltage according to grayscale data set in the  $\gamma$ -correction register to display in 262,144 colors. For details, see the “ $\gamma$ -Correction Register” section.

## **Timing Controller**

The timing generator generates a timing signal for operation of internal circuits such as the internal GRAM. The timing for the display operation such as RAM read operation and the timing for the internal operation such as access from the MPU are generated in the way not to interfere each other.

## **Oscillator (OSC)**

ILI9325 generates RC oscillation with an external oscillation resistor placed between the OSC1 and OSC2 pins. The oscillation frequency is changed according to the value of an external resistor. Adjust the oscillation frequency in accordance to the operating voltage or the frame frequency. An operating clock can be input externally. During standby mode, RC oscillation is halted to reduce power consumption. For details, see “Oscillator”.

## **LCD Driver Circuit**

The LCD driver circuit of ILI9325 consists of a 720-output source driver (S1 ~ S720) and a 320-output gate driver (G1~G320). Display pattern data are latched when the 720<sup>th</sup> bit data are input. The latched data control

the source driver and generate a drive waveform. The gate driver for scanning gate lines outputs either VGH or VGL level. The shift direction of 720 source outputs from the source driver is set with the SS bit and the shift direction of gate outputs from the gate driver is set with the GS bit. The scan mode by the gate driver is set with the SM bit. These bits allow setting an appropriate scan method for an LCD module.

### **LCD Driver Power Supply Circuit**

The LCD drive power supply circuit generates the voltage levels VREG1OUT, VGH, VGL and Vcom for driving an LCD.

## 7. System Interface

### 7.1. Interface Specifications

ILI9325 has the system interface to read/write the control registers and display graphics memory (GRAM), and the RGB Input Interface for displaying a moving picture. User can select an optimum interface to display the moving or still picture with efficient data transfer. All display data are stored in the GRAM to reduce the data transfer efforts and only the updating data is necessary to be transferred. User can only update a sub-range of GRAM by using the window address function.

ILI9325 also has the RGB interface and VSYNC interface to transfer the display data without flicker the moving picture on the screen. In RGB interface mode, the display data is written into the GRAM through the control signals of ENABLE, VSYNC, HSYNC, DOTCLK and data bus DB[17:0].

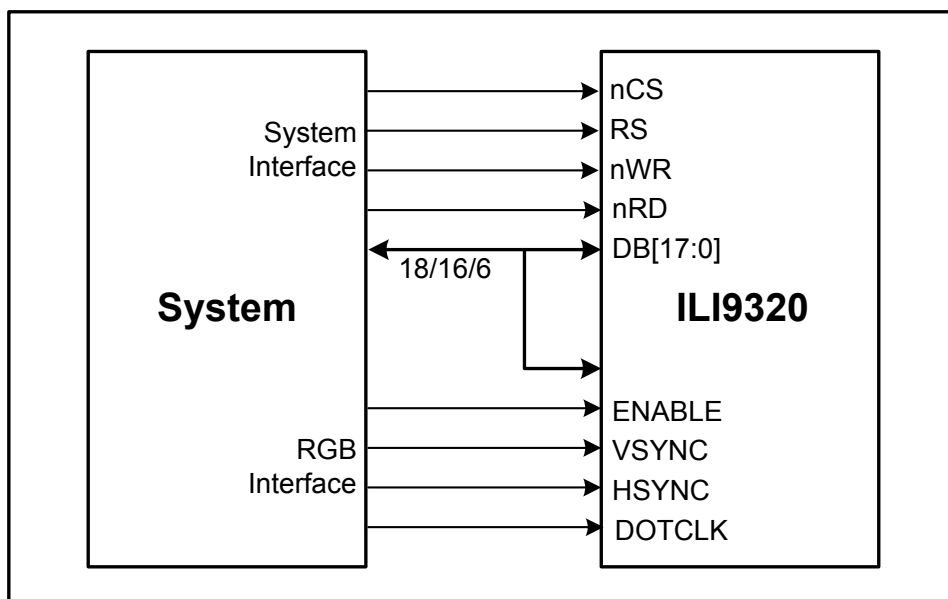

In VSYNC interface mode, the internal display timing is synchronized with the frame synchronization signal (VSYNC). The VSYNC interface mode enables to display the moving picture display through the system interface. In this case, there are some constraints of speed and method to write data to the internal RAM.

ILI9325 operates in one of the following 4 modes. The display mode can be switched by the control register. When switching from one mode to another, refer to the sequences mentioned in the sections of RGB and VSYNC interfaces.

Operation Mode	RAM Access Setting (RM)	Display Operation Mode (DM[1:0])
Internal operating clock only (Displaying still pictures)	System interface (RM = 0)	Internal operating clock (DM[1:0] = 00)
RGB interface (1) (Displaying moving pictures)	RGB interface (RM = 1)	RGB interface (DM[1:0] = 01)
RGB interface (2) (Rewriting still pictures while displaying moving pictures)	System interface (RM = 0)	RGB interface (DM[1:0] = 01)
VSYNC interface (Displaying moving pictures)	System interface (RM = 0)	VSYNC interface (DM[1:0] = 01)

Note 1) Registers are set only via the system interface.

Note 2) The RGB-I/F and the VSYNC-I/F are not available simultaneously.

## 7.2. Input Interfaces

The following are the system interfaces available with the ILI9325. The interface is selected by setting the IM[3:0] pins. The system interface is used for setting registers and GRAM access.

IM3	IM2	IM1	IM0/ID	Interface Mode	DB Pin
0	0	0	0	Setting invalid	
0	0	0	1	Setting invalid	
0	0	1	0	i80-system 16-bit interface	DB[17:10], DB[8:1]

### 7.2.1. i80/18-bit System Interface

The i80/18-bit system interface is selected by setting the IM[3:0] as "1010" levels.

**Figure2 18-bit System Interface Data Format**

### 7.2.2. i80/16-bit System Interface

The i80/16-bit system interface is selected by setting the IM[3:0] as "0010" levels. The 262K or 65K color can be display through the 16-bit MPU interface. When the 262K color is displayed, two transfers (1<sup>st</sup> transfer: 2 bits, 2<sup>nd</sup> transfer: 16 bits or 1<sup>st</sup> transfer: 16 bits, 2<sup>nd</sup> transfer: 2 bits) are necessary for the 16-bit CPU interface.

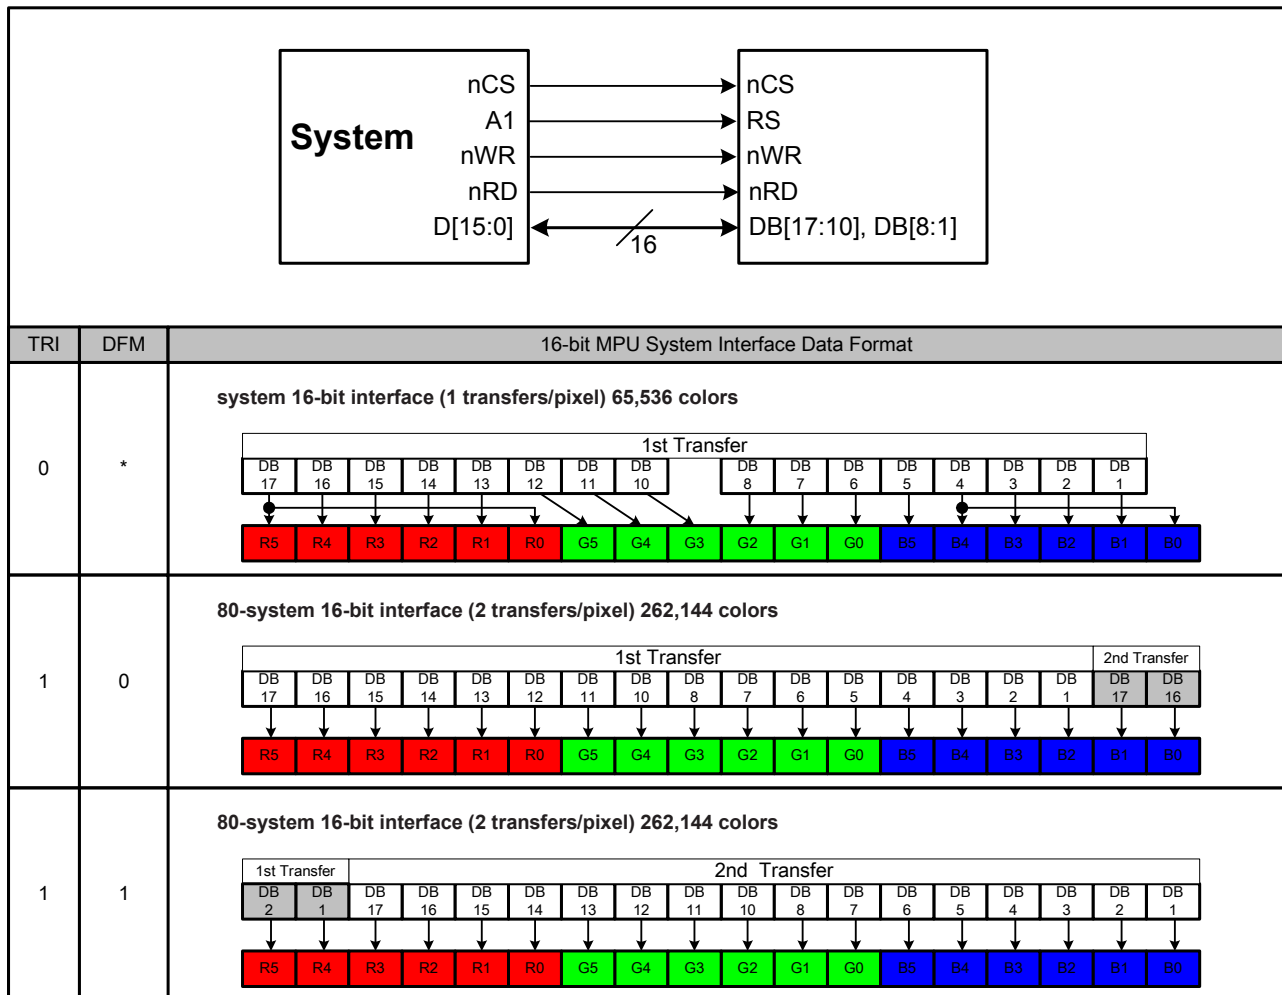

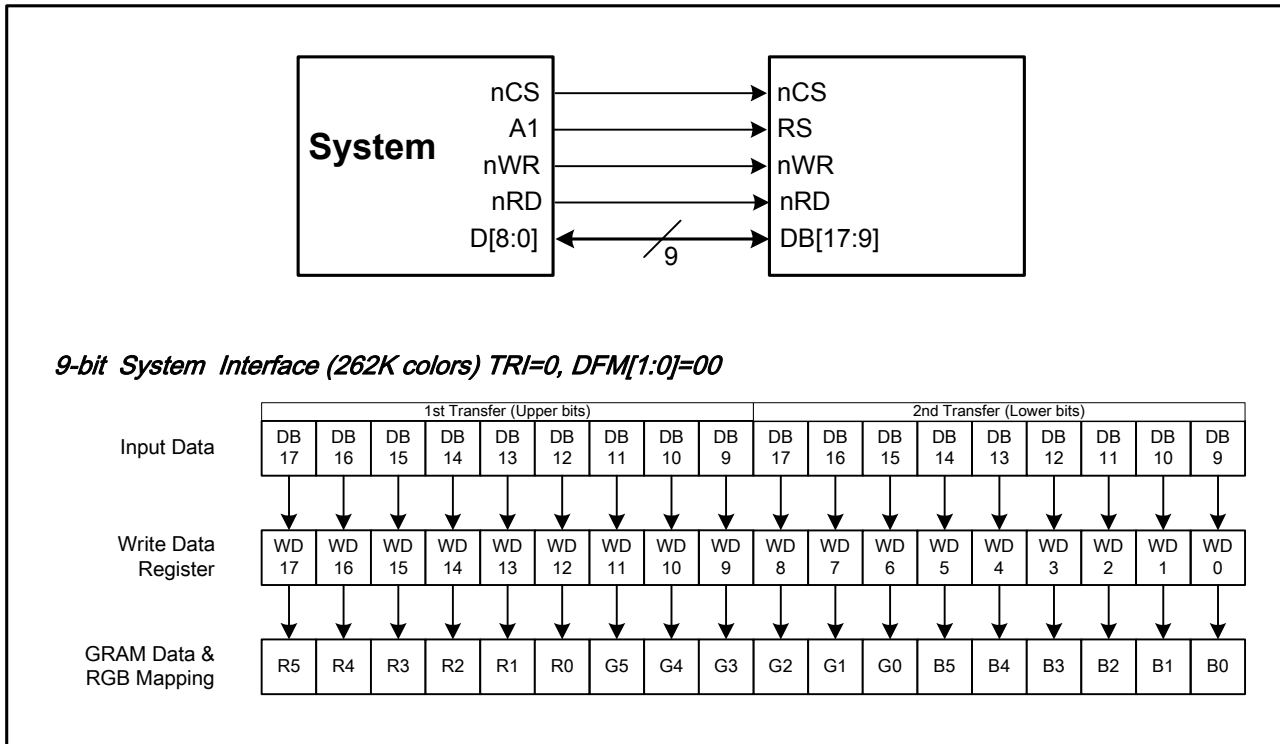

Figure3 16-bit System Interface Data Format

### 7.2.3. i80/9-bit System Interface

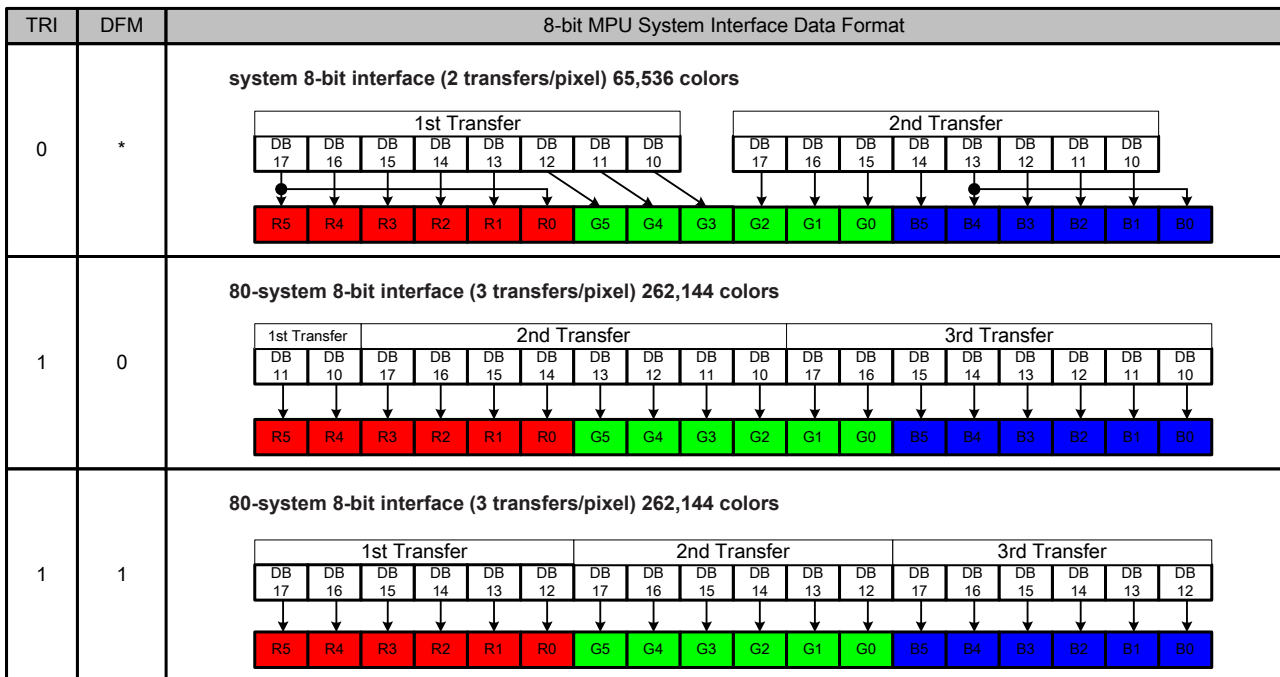

The i80/9-bit system interface is selected by setting the IM[3:0] as “1011” and the DB17~DB9 pins are used to transfer the data. When writing the 16-bit register, the data is divided into upper byte (8 bits and LSB is not used) lower byte and the upper byte is transferred first. The display data is also divided in upper byte (9 bits) and lower byte, and the upper byte is transferred first. The unused DB[8:0] pins must be tied to either Vcc or AGND.

**Figure4 9-bit System Interface Data Format**

### 7.2.4. i80/8-bit System Interface

The i80/8-bit system interface is selected by setting the IM[3:0] as “0011” and the DB17~DB10 pins are used to transfer the data. When writing the 16-bit register, the data is divided into upper byte (8 bits and LSB is not used) lower byte and the upper byte is transferred first. The display data is also divided in upper byte (8 bits) and lower byte, and the upper byte is transferred first. The written data is expanded into 18 bits internally (see the figure below) and then written into GRAM. The unused DB[9:0] pins must be tied to either Vcc or AGND.

**Figure5 8-bit System Interface Data Format**

#### Data transfer synchronization in 8/9-bit bus interface mode

ILI9325 supports a data transfer synchronization function to reset upper and lower counters which count the transfers numbers of upper and lower byte in 8/9-bit interface mode. If a mismatch arises in the numbers of transfers between the upper and lower byte counters due to noise and so on, the "00" register is written 4 times consecutively to reset the upper and lower counters so that data transfer will restart with a transfer of upper byte. This synchronization function can effectively prevent display error if the upper/lower counters are periodically reset.

**Figure6 Data Transfer Synchronization in 8/9-bit System Interface**

### 7.3. Serial Peripheral Interface (SPI)

The Serial Peripheral Interface (SPI) is selected by setting the IM[3:0] pins as "010x" level. The chip select pin

(nCS), the serial transfer clock pin (SCL), the serial data input pin (SDI) and the serial data output pin (SDO) are used in SPI mode. The ID pin sets the least significant bit of the identification code. The DB[17:0] pins, which are not used, must be tied to either IOVcc or DGND.

The SPI interface operation enables from the falling edge of nCS and ends of data transfer on the rising edge of nCS. The start byte is transferred to start the SPI interface and the read/write operation and RS information are also included in the start byte. When the start byte is matched, the subsequent data is received by ILI9325.

The seventh bit of start byte is RS bit. When RS = "0", either index write operation or status read operation is executed. When RS = "1", either register write operation or RAM read/write operation is executed. The eighth bit of the start byte is used to select either read or write operation (R/W bit). Data is written when the R/W bit is "0" and read back when the R/W bit is "1".

After receiving the start byte, ILI9325 starts to transfer or receive the data in unit of byte and the data transfer starts from the MSB bit. All the registers of the ILI9325 are 16-bit format and receive the first and the second byte data as the upper and the lower eight bits of the 16-bit register respectively. In SPI mode, 5 bytes dummy read is necessary and the valid data starts from 6<sup>th</sup> byte of read back data.

#### Start Byte Format

Transferred bits	S	1	2	3	4	5	6	7	8
Start byte format	Transfer start	Device ID code					ID	RS	R/W
		0	1	1	1	0		1/0	1/0

Note: ID bit is selected by setting the IM0/ID pin.

## 7.4. VSYNC Interface

ILI9325 supports the VSYNC interface in synchronization with the frame-synchronizing signal VSYNC to display the moving picture with the i80 system interface. When the VSYNC interface is selected to display a moving picture, the minimum GRAM update speed is limited and the VSYNC interface is enabled by setting DM[1:0] = "10" and RM = "0".

**Figure10 Data transmission through VSYNC interface)**

In the VSYNC mode, the display operation is synchronized with the internal clock and VSYNC input and the frame rate is determined by the pulse rate of VSYNC signal. All display data are stored in GRAM to minimize total data transfer required for moving picture display.

**Figure11 Moving picture data transmission through VSYNC interface**

**Figure12 Operation through VSYNC Interface**

The VSYNC interface has the minimum speed limitation of writing data to the internal GRAM via the system interface, which are calculated from the following formula.

*Internal clock frequency (fosc.) [Hz] = FrameFrequency x (DisplayLine (NL) + FrontPorch (FP) + BackPorch (BP)) x ClockCyclePerLines (RTN) x FrequencyFluctuation.*

$$\text{Minimum RAM write speed (HZ)} > \frac{320 \times \text{DisplayLines (NL)}}{[(\text{BackPorch(BP)} + \text{DisplayLines(NL)} - \text{margins}) \times 16 (\text{clocks}) \times 1/\text{fosc}]}$$

*Note: When the RAM write operation does not start from the falling edge of VSYNC, the time from the falling edge of VSYNC until the start of RAM write operation must also be taken into account.*

An example of minimum GRAM writing speed and internal clock frequency in VSYNC interface mode is as below.

**[Example]**

Display size: 240 RGB × 320 lines

Lines: 320 lines (NL = 1000111)

Back porch: 14 lines (BP = 1110)

Front porch: 2 lines (FP = 0010)

Frame frequency: 60 Hz

Frequency fluctuation: 10%

$$\text{Internal oscillator clock (fosc.) [Hz]} = 60 \times [320 + 2 + 14] \times 16 \text{ clocks} \times (1.1/0.9) \div 394\text{KHz}$$

When calculate the internal clock frequency, the oscillator variation is needed to be taken into consideration. In the above example, the calculated internal clock frequency with  $\pm 10\%$  margin variation is considered and ensures to complete the display operation within one VSYNC cycle. The causes of frequency variation come from fabrication process of LSI, room temperature, external resistors and VCI voltage variation.

$$\text{Minimum speed for RAM writing [Hz]} > 240 \times 320 \times 394K / [(14 + 320 - 2)\text{lines} \times 16\text{clocks}] \doteq 5.7 \text{ MHz}$$

The above theoretical value is calculated based on the premise that the ILI9325 starts to write data into the internal GRAM on the falling edge of VSYNC. There must at least be a margin of 2 lines between the physical display line and the GRAM line address where data writing operation is performed. The GRAM write speed of 5.7MHz or more will guarantee the completion of GRAM write operation before the ILI9325 starts to display the GRAM data on the screen and enable to rewrite the entire screen without flicker.

#### Notes in using the VSYNC interface

1. The minimum GRAM write speed must be satisfied and the frequency variation must be taken into consideration.
2. The display frame rate is determined by the VSYNC signal and the period of VSYNC must be longer than the scan period of an entire display.
3. When switching from the internal clock operation mode (DM[1:0] = "00") to the VSYNC interface mode or inversely, the switching starts from the next VSYNC cycle, i.e. after completing the display of the frame.
4. The partial display, vertical scroll, and interlaced scan functions are not available in VSYNC interface mode and set the AM bit to "0" to transfer display data.

**Figure13 Transition flow between VSYNC and internal clock operation modes**

## 7.5. RGB Input Interface

The RGB Interface mode is available for ILI9325 and the interface is selected by setting the RIM[1:0] bits as following table.

RIM1	RIM0	RGB Interface	DB pins
0	0	18-bit RGB Interface	DB[17:0]
0	1	16-bit RGB Interface	DB[17:13], DB[11:1]
1	0	6-bit RGB Interface	DB[17:12]

### 7.5.1. RGB Interface

The display operation via the RGB interface is synchronized with the VSYNC, HSYNC, and DOTCLK signals. The RGB interface transfers the updated data to GRAM with the high-speed write function and the update area is defined by the window address function. The back porch and front porch are used to set the RGB interface timing.

**Figure15 GRAM Access Area by RGB Interface**

### 7.5.2. RGB Interface Timing

The timing chart of 18-/16-bit RGB interface mode is shown as follows.

**Figure16 Timing Chart of Signals in 18-/16-bit RGB Interface Mode**

The timing chart of 6-bit RGB interface mode is shown as follows.

**Figure17 Timing chart of signals in 6-bit RGB interface mode**

### 7.5.3. Moving Picture Mode

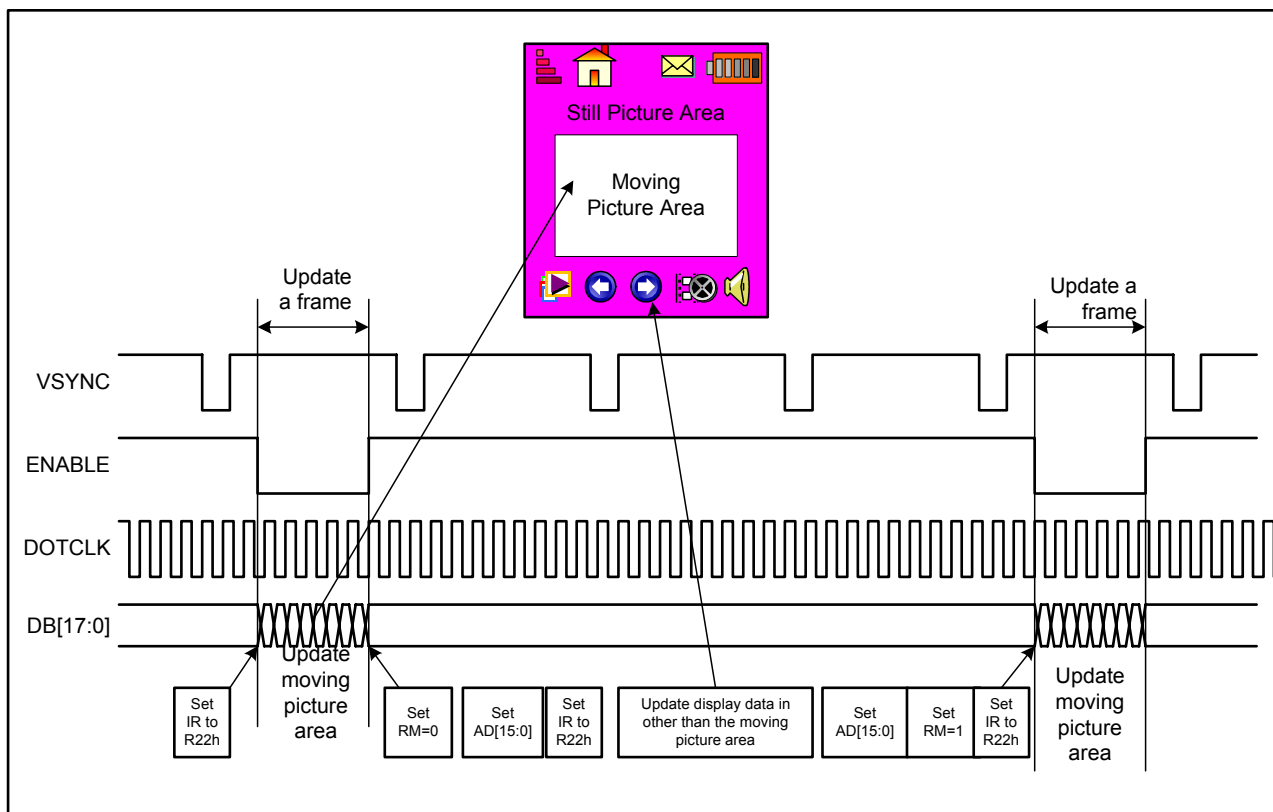

ILI9325 has the RGB interface to display moving picture and incorporates GRAM to store display data, which has following merits in displaying a moving picture.

- The window address function defined the update area of GRAM.
- Only the moving picture area of GRAM is updated.
- When display the moving picture in RGB interface mode, the DB[17:0] can be switched as system interface to update still picture area and registers, such as icons.

#### RAM access via a system interface in RGB-I/F mode

ILI9325 allows GRAM access via the system interface in RGB interface mode. In RGB interface mode, data are written to the internal GRAM in synchronization with DOTCLK and ENABLE signals. When write data to the internal GRAM by the system interface, set ENABLE to terminate the RGB interface and switch to the system interface to update the registers (RM = "0") and the still picture of GRAM. When restart RAM access in RGB interface mode, wait one read/write cycle and then set RM = "1" and the index register to R22h to start accessing RAM via the RGB interface. If RAM accesses via two interfaces conflicts, there is no guarantee that data are written to the internal GRAM.

The following figure illustrates the operation of the ILI9325 when displaying a moving picture via the RGB interface and rewriting the still picture RAM area via the system interface.

**Figure18 Example of update the still and moving picture**

#### 7.5.4. 6-bit RGB Interface

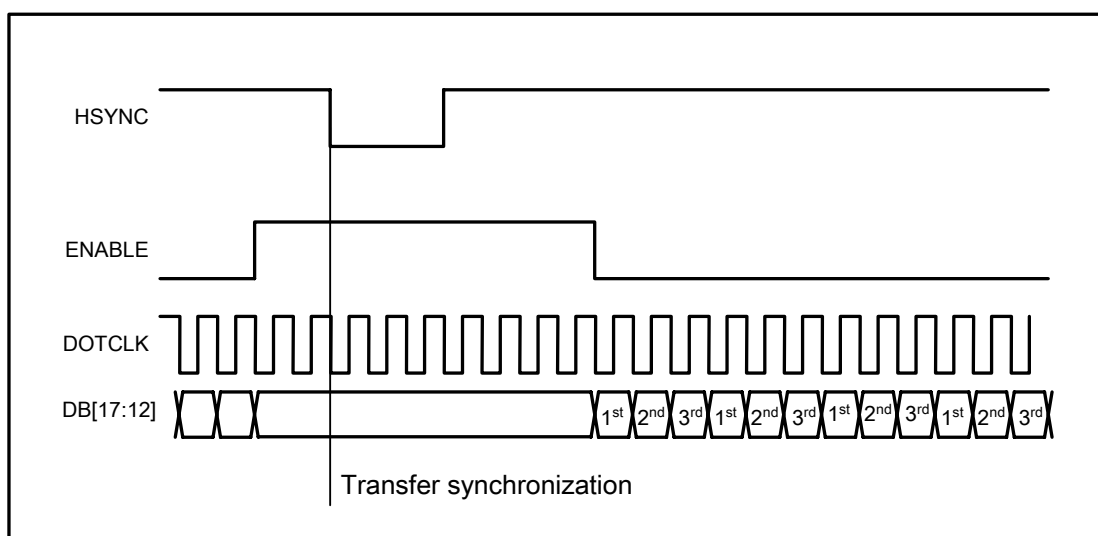

The 6-bit RGB interface is selected by setting the RIM[1:0] bits to “10”. The display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Display data are transferred to the internal GRAM in synchronization with the display operation via 6-bit RGB data bus (DB[17:12]) according to the data enable signal (ENABLE). Unused pins (DB[11:0]) must be fixed at either IOVcc or DGND level. Registers can be set by the system interface (i80/SPI).

#### Data transfer synchronization in 6-bit RGB interface mode

ILI9325 has data transfer counters to count the first, second, third data transfers in 6-bit RGB interface mode. The transfer counter is always reset to the state of first data transfer on the falling edge of VSYNC. If a mismatch arises in the number of each data transfer, the counter is reset to the state of first data transfer at the start of the frame (i.e. on the falling edge of VSYNC) to restart data transfer in the correct order from the next frame. This function is expedient for moving picture display, which requires consecutive data transfer in light of minimizing effects from failed data transfer and enabling the system to return to a normal state.

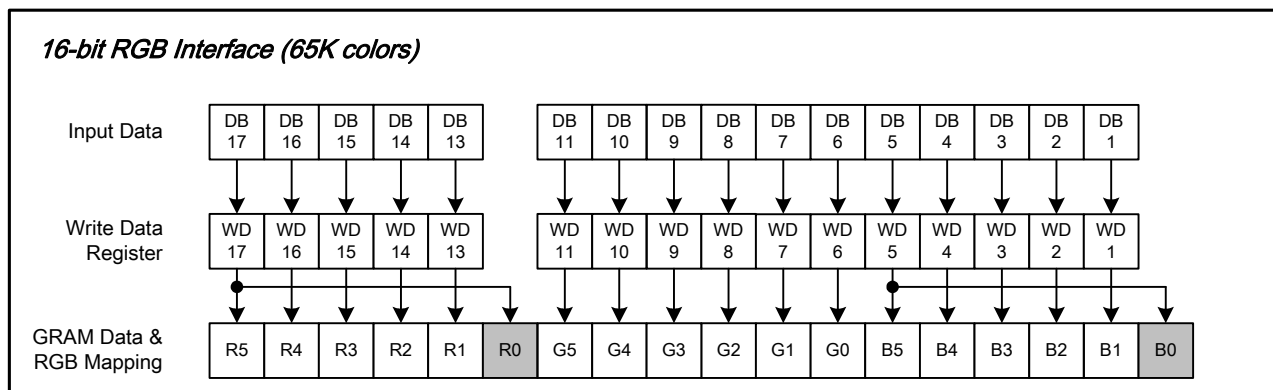

Note that internal display operation is performed in units of pixels (RGB: taking 3 inputs of DOTCLK). Accordingly, the number of DOTCLK inputs in one frame period must be a multiple of 3 to complete data transfer correctly. Otherwise it will affect the display of that frame as well as the next frame.

### 7.5.5. 16-bit RGB Interface

The 16-bit RGB interface is selected by setting the RIM[1:0] bits to "01". The display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Display data are transferred to the internal RAM in synchronization with the display operation via 16-bit RGB data bus (DB17-13, DB11-1) according to the data enable signal (ENABLE). Registers are set only via the system interface.

### 7.5.6. 18-bit RGB Interface

The 18-bit RGB interface is selected by setting the RIM[1:0] bits to "00". The display operation is synchronized with VSYNC, HSYNC, and DOTCLK signals. Display data are transferred to the internal RAM in synchronization with the display operation via 18-bit RGB data bus (DB[17:0]) according to the data enable signal (ENABLE). Registers are set only via the system interface.

### Notes in using the RGB Input Interface

1. The following are the functions not available in RGB Input Interface mode.

Function	RGB interface	I80 system interface
Partial display	Not available	Available
Scroll function	Not available	Available
Interlaced scan	Not available	Available
Graphics operation function	Not available	Available

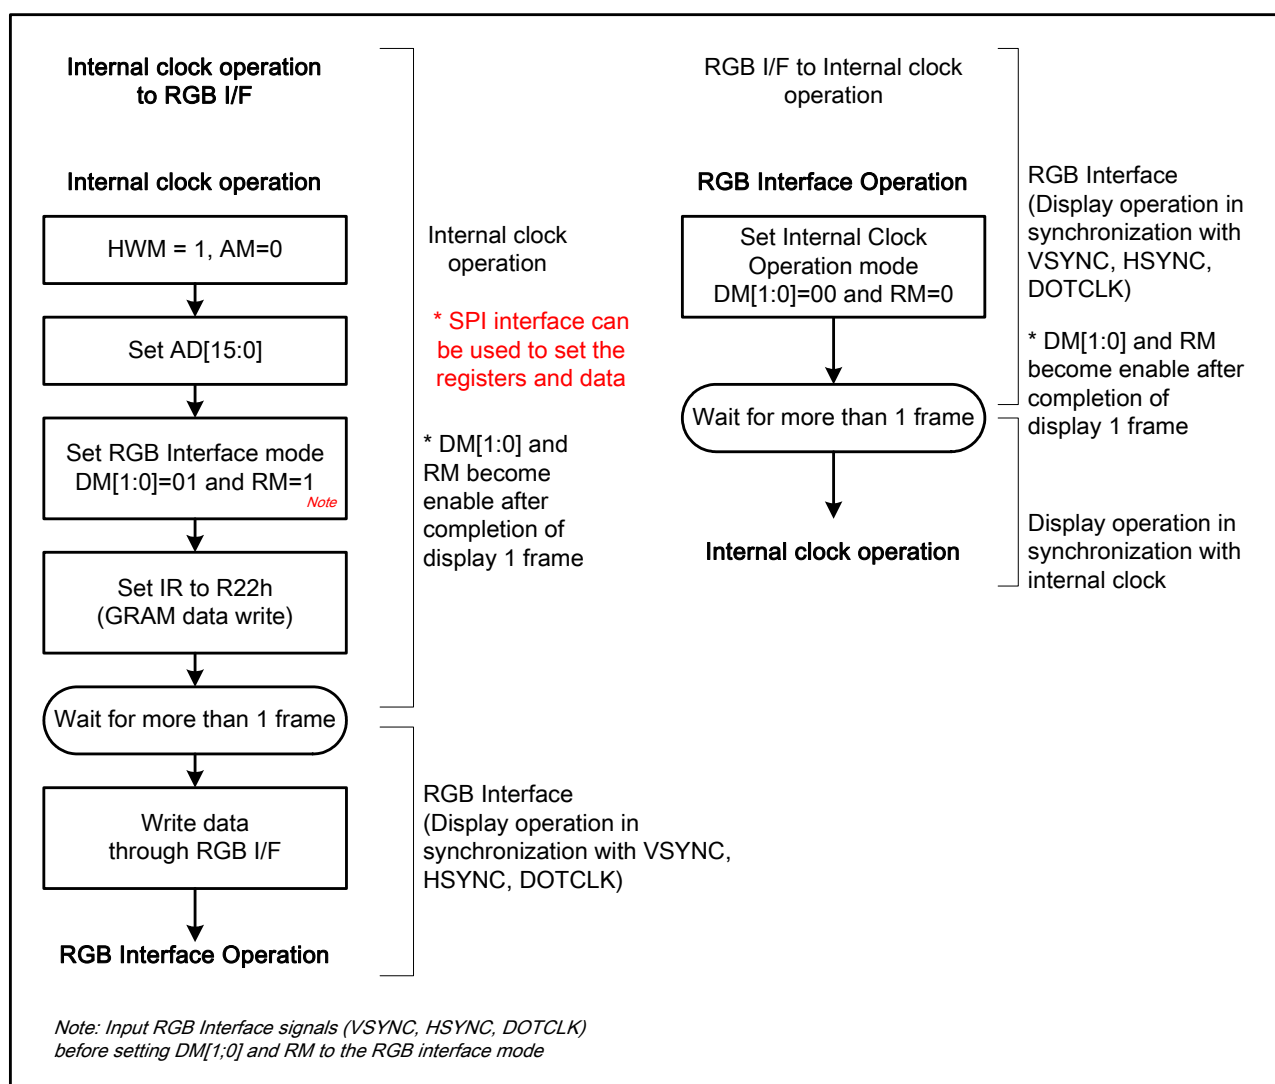

2. VSYNC, HSYNC, and DOTCLK signals must be supplied throughout a display operation period.

3. The periods set with the NO[1:0] bits (gate output non-overlap period), STD[1:0] bits (source output delay period) and EQ[1:0] bits (equalization period) are not based on the internal clock but based on DOTCLK in

RGB interface mode.

4. In 6-bit RGB interface mode, each of RGB dots is transferred in synchronization with a DOTCLK input. In other words, it takes 3 DOTCLK inputs to transfer one pixel. Be sure to complete data transfer in units of 3 DOTCLK inputs in 6-bit RGB interface mode.
5. In 6-bit RGB interface mode, data of one pixel, which consists of RGB dots, are transferred in units of 3 DOTCLK. Accordingly, set the cycle of each signal in 6-bit interface mode (VSYNC, HSYNC, ENABLE, DB[17:0]) to contain DOTCLK inputs of a multiple of 3 to complete data transfer in units of pixels.
6. When switching from the internal operation mode to the RGB Input Interface mode, or the other way around, follow the sequence below.
7. In RGB interface mode, the front porch period continues until the next VSYNC input is detected after drawing one frame.
8. In RGB interface mode, a RAM address (AD[15:0]) is set in the address counter every frame on the falling edge of VSYNC.

## 8. Register Descriptions

### 8.1. Registers Access

ILI9325 adopts 18-bit bus interface architecture for high-performance microprocessor. All the functional blocks of ILI9325 starts to work after receiving the correct instruction from the external microprocessor by the 18-, 16-, 9-, 8-bit interface. The index register (IR) stores the register address to which the instructions and display data will be written. The register selection signal (RS), the read/write signals (nRD/nWR) and data bus D17-0 are used to read/write the instructions and data of ILI9325. The registers of the ILI9325 are categorized into the following groups.

1. Specify the index of register (IR)
2. Read a status
3. Display control
4. Power management Control
5. Graphics data processing
6. Set internal GRAM address (AC)
7. Transfer data to/from the internal GRAM (R22)
8. Internal grayscale  $\gamma$ -correction (R30 ~ R39)

Normally, the display data (GRAM) is most often updated, and in order since the ILI9325 can update internal GRAM address automatically as it writes data to the internal GRAM and minimize data transfer by using the window address function, there are fewer loads on the program in the microprocessor. As the following figure shows, the way of assigning data to the 16 register bits (D[15:0]) varies for each interface. Send registers in accordance with the following data transfer format.

### 8.2.1. Index (IR)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	0	-	-	-	-	-	-	-	-	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

The index register specifies the address of register (R00h ~ RFFh) or RAM which will be accessed.

### 8.2.2. Status Read (RS)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R	0	L7	L6	L5	L4	L3	L2	L1	L0	0	0	0	0	0	0	0	0

The SR bits represent the internal status of the ILI9325.

**L[7:0]** Indicates the position of driving line which is driving the TFT panel currently.

### 8.2.3. Start Oscillation (R00h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	1
R	1	1	0	0	1	0	0	1	1	0	0	1	0	0	0	0	0

Set the OSC bit as '1' to start the internal oscillator and as '0' to stop the oscillator. Wait at least 10ms to let the frequency of oscillator stable and then do the other function setting. The device code "9320" is read out when read this register.

### 8.2.4. Driver Output Control (R01h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	SM	0	SS	0	0	0	0	0	0	0	0

**SS:** Select the shift direction of outputs from the source driver.

When SS = 0, the shift direction of outputs is from S1 to S720

When SS = 1, the shift direction of outputs is from S720 to S1.

In addition to the shift direction, the settings for both SS and BGR bits are required to change the assignment of R, G, B dots to the source driver pins.

To assign R, G, B dots to the source driver pins from S1 to S720, set SS = 0.

To assign R, G, B dots to the source driver pins from S720 to S1, set SS = 1.

**When changing SS or BGR bits, RAM data must be rewritten.**

**SM:** Sets the gate driver pin arrangement in combination with the GS bit (R60h) to select the optimal scan mode for the module.

SM	GS	Scan Direction	Gate Output Sequence
0	0		<p>G1, G2, G3, G4, ..., G316</p> <p>G317, G318, G319, G320</p>
0	1		<p>G320, G319, G318, ...,</p> <p>G6, G5, G4, G3, G2, G1</p>
1	0		<p>G1, G3, G5, G7, ..., G311</p> <p>G313, G315, G317, G319</p> <p>G2, G4, G6, G8, ..., G312</p> <p>G314, G316, G318, G320</p>
1	1		<p>G320, G318, G316, ...,</p> <p>G10, G8, G6, G4, G2</p> <p>G319, G317, G315, ...,</p> <p>G9, G78, G5, G3, G1</p>

### 8.2.5. LCD Driving Wave Control (R02h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	1	B/C	EOR	0	0	0	0	0	0	0	0

**B/C** 0 : Frame/Field inversion

1 : Line inversion

**EOR:** EOR = 1 and B/C=1 to set the line inversion.

### 8.2.6. Entry Mode (R03h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	TRI	DFM	0	BGR	0	0	HWM	0	ORG	0	I/D1	I/D0	AM	0	0	0

**AM** Control the GRAM update direction.

When AM = "0", the address is updated in horizontal writing direction.

When AM = "1", the address is updated in vertical writing direction.

When a window area is set by registers R50h ~R53h, only the addressed GRAM area is updated based on I/D[1:0] and AM bits setting.

**I/D[1:0]** Control the address counter (AC) to automatically increase or decrease by 1 when update one pixel display data. Refer to the following figure for the details.

	I/D[1:0] = 00 Horizontal : decrement Vertical : decrement	I/D[1:0] = 01 Horizontal : increment Vertical : decrement	I/D[1:0] = 10 Horizontal : decrement Vertical : increment	I/D[1:0] = 11 Horizontal : increment Vertical : increment
AM = 0 Horizontal				
AM = 1 Vertical				

**Figure25 GRAM Access Direction Setting**

**ORG** Moves the origin address according to the ID setting when a window address area is made. This function is enabled when writing data with the window address area using high-speed RAM write.

ORG = "0": The origin address is not moved. In this case, specify the address to start write operation according to the GRAM address map within the window address area.

ORG = "1": The original address "00000h" moves according to the I/D[1:0] setting.

Notes: 1. When ORG=1, only the origin address address"00000h" can be set in the RAM address set registers R20h, and R21h.

2. In RAM read operation, make sure to set ORG=0.

**BGR** Swap the R and B order of written data.

BGR="0": Follow the RGB order to write the pixel data.

BGR="1": Swap the RGB data to BGR in writing into GRAM.

**TRI** When TRI = "1", data are transferred to the internal RAM in 8-bit x 3 transfers mode via the 8-bit interface. It is also possible to send data via the 16-bit interface or SPI in the transfer mode that realizes display in 262k colors in combination with DFM bits. When not using these interface modes, be sure to set TRI = "0".

**DFM** Set the mode of transferring data to the internal RAM when TRI = "1". See the following figures for details.

**Figure26 16-bit MPU System Interface Data Format**

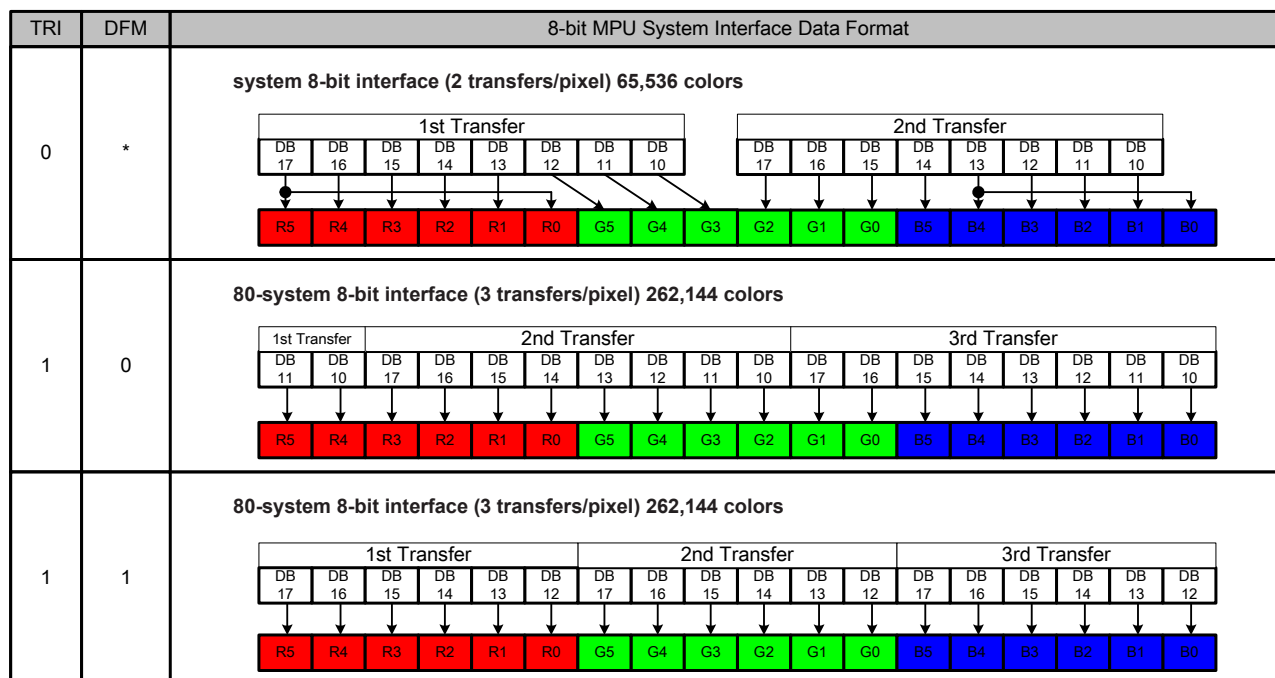

Figure27 8-bit MPU System Interface Data Format

### 8.2.7. Resizing Control Register (R04h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	0	0	0	0	RCV1	RCV0	0	0	RCH1	RCH0	0	0	RSZ1	RSZ0

**RSZ[1:0]** Sets the resizing factor.

When the RSZ bits are set for resizing, the ILI9325 writes the data according to the resizing factor so that the original image is displayed in horizontal and vertical dimensions, which are contracted according to the factor respectively. See “Resizing function”.

**RCH[1:0]** Sets the number of remainder pixels in horizontal direction when resizing a picture.

By specifying the number of remainder pixels by RCH bits, the data can be transferred without taking the reminder pixels into consideration. Make sure that RCH = 2'h0 when not using the resizing function (RSZ = 2'h0) or there are no remainder pixels.

**RCV[1:0]** Sets the number of remainder pixels in vertical direction when resizing a picture.

By specifying the number of remainder pixels by RCV bits, the data can be transferred without taking the reminder pixels into consideration. Make sure that RCV = 2'h0 when not using the resizing function (RSZ = 2'h0) or there are no remainder pixels.

RSZ[1:0]	Resizing factor
00	No resizing (x1)
01	x 1/2
10	Setting prohibited
11	x 1/4

RCH[1:0]	Number of remainder Pixels in Horizontal Direction
00	0 pixel*

01	1 pixel
10	2 pixel
11	3 pixel

RCV[1:0]	Number of remainder Pixels in Vertical Direction
00	0 pixel*
01	1 pixel
10	2 pixel
11	3 pixel

\*1 pixel = 1RGB

### 8.2.8. Display Control 1 (R07h)

R/W	RS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
W	1	0	0	PTDE1	PTDE0	0	0	BASEE	0	0	0	GON	DTE	CL	0	D1	D0

**D[1:0]** Set D[1:0]="11" to turn on the display panel, and D[1:0]="00" to turn off the display panel.

A graphics display is turned on the panel when writing D1 = "1", and is turned off when writing D1 = "0".

When writing D1 = "0", the graphics display data is retained in the internal GRAM and the ILI9325 displays the data when writing D1 = "1". When D1 = "0", i.e. while no display is shown on the panel, all source outputs becomes the GND level to reduce charging/discharging current, which is generated within the LCD while driving liquid crystal with AC voltage.

When the display is turned off by setting D[1:0] = "01", the ILI9325 continues internal display operation. When the display is turned off by setting D[1:0] = "00", the ILI9325 internal display operation is halted completely. In combination with the GON, DTE setting, the D[1:0] setting controls display ON/OFF.

D1	D0	BASEE	Source, VCOM Output	ILI9325 internal operation
0	0	0	GND	Halt
0	1	1	GND	Operate
1	0	0	Non-lit display	Operate
1	1	0	Non-lit display	Operate
1	1	1	Base image display	Operate

Note: 1. data write operation from the microcontroller is performed irrespective of the setting of D[1:0] bits.

2. The D[1:0] setting is valid on both 1<sup>st</sup> and 2<sup>nd</sup> displays.

3. The non-lit display level from the source output pins is determined by instruction (PTS).

**CL** When CL = "1", the 8-color display mode is selected.

CL	Colors
0	262,144
1	8

**GON and DTE** Set the output level of gate driver G1 ~ G320 as follows

GON	DTE	G1 ~G320 Gate Output
0	0	VGH
0	1	VGH

1	0	VGL
1	1	Normal Display

## BASEE

Base image display enable bit. When BASEE = "0", no base image is displayed. The ILI9325 drives liquid crystal at non-lit display level or displays only partial images. When BASEE = "1", the base image is displayed. The D[1:0] setting has higher priority over the BASEE setting.

## PTDE[1:0]

Partial image 2 and Partial image 1 enable bits

PTDE1/0 = 0: turns off partial image. Only base image is displayed.

PTDE1/0 = 1: turns on partial image. Set the base image display enable bit to 0 (BASEE = 0).

## 8.2.9. Display Control 2 (R08h)

## FP[3:0]/BP[3:0]

The FP[3:0] and BP[3:0] bits specify the line number of front and back porch periods respectively.

When setting the FP[3:0] and BP[3:0] value, the following conditions shall be met:

$BP + FP \leq 16$  lines

**$FP \geq 2$  lines**

**$BP \geq 2$  lines**

Set the BP[3:0] and FP[3:0] bits as below for each operation modes

Operation Mode	BP	FP	BP+FP
180 System Interface Operation Mode	$BP \geq 2$ lines	$FP \geq 2$ lines	$FP + BP \leq 16$ lines
RGB interface Operation	$BP \geq 2$ lines	$FP \geq 2$ lines	$FP + BP \leq 16$ lines

0	1	Setting Prohibited	-	-
1	0	Interval scan	Set with the PTS[2:0] bits	VcomH/VcomL
1	1	Setting Prohibited	-	-

### PTS[2:0]

Set the source output level in non-display area drive period (front/back porch period and blank area between partial displays).

When PTS[2] = 1, the operation of amplifiers which generates the grayscales other than V0 and V63 are halted and the step-up clock frequency becomes half the normal frequency in non-display drive period in order to reduce power consumption.

PTS[2:0]	Source output level		Grayscale amplifier in operation	Step-up clock frequency

**SLP:** When SLP = 1, ILI9325 enters the sleep mode and the display operation stops except the RC oscillator to reduce the power consumption. In the sleep mode, the GRAM data and instructions cannot be updated except the following two instructions.

- Exit sleep mode (SLP = "0")
- Start oscillation

**STB:** When STB = 1, ILI9325 enters the standby mode and the display operation stops except the GRAM power supply to reduce the power consumption. In the sleep mode, the GRAM data and instructions cannot be updated except the following two instructions.

- Exit standby mode (STB = "0")
- Start oscillation

**DSTB:** When DSTB = 1, the ILI9325 enters the deep standby mode. In deep standby mode, the internal logic power supply is turned off to reduce power consumption. The GRAM data and instruction setting are not maintained when the ILI9325 enters the deep standby mode, and they must be reset after exiting deep

standby mode.

**AP[2:0]:** Adjusts the constant current in the operational amplifier circuit in the LCD power supply circuit. The larger constant current enhances the drivability of the LCD, but it also increases the current consumption. Adjust the constant current taking the trade-off into account between the display quality and the current consumption. In no-display period, set AP[2:0] = "000" to halt the operational amplifier circuits and the step-up circuits to reduce current consumption.

**HSA[7:0]/HEA[7:0]** HSA[7:0] and HEA[7:0] represent the respective addresses at the start and end of the window address area in horizontal direction. By setting HSA and HEA bits, it is possible to limit the area on the GRAM horizontally for writing data. The HSA and HEA bits must be set before starting RAM write operation. In setting these bits, be sure “00”h ≤ HSA[7:0] < HEA[7:0] ≤ “EF”h. and

"04"h ≤ HEA-HAS.

**VSA[8:0]/VEA[8:0]** VSA[8:0] and VEA[8:0] represent the respective addresses at the start and end of the window address area in vertical direction. By setting VSA and VEA bits, it is possible to limit the area on the GRAM vertically for writing data. The VSA and VEA bits must be set before starting RAM write operation. In setting, be sure "000"h ≤ VSA[8:0] < VEA[8:0] ≤ "13F"h.

"00"h ≤ HAS[7:0] ≤ HEA[7:0] ≤ "EF"h

"00"h ≤ VSA[7:0] ≤ VEA[7:0] ≤ "13F"h

*Note1. The window address range must be within the GRAM address space.*

*Note2. Data are written to GRAM in four-words when operating in high speed mode, the dummy write operations should be inserted depending on the window address area. For details, see the High-Speed RAM Write Function section.*

**GS:** Sets the direction of scan by the gate driver in the range determined by SCN[4:0] and NL[4:0]. The scan direction determined by GS = 0 can be reversed by setting GS = 1.

When GS = 0, the scan direction is from G1 to G320.

When GS = 1, the scan direction is from G320 to G1

**REV:** Enables the grayscale inversion of the image by setting REV=1.

**VLE:** Vertical scroll display enable bit. When VLE = 1, the ILI9325 starts displaying the base image from the line (of the physical display) determined by VL[8:0] bits. VL[8:0] sets the amount of scrolling, which is the number of lines to shift the start line of the display from the first line of the physical display. Note that the partial image display position is not affected by the base image scrolling.

The vertical scrolling is not available in external display interface operation. In this case, make sure to set VLE = "0".

VLE	Base Image Display
0	Fixed
1	Enable Scrolling

**VL[8:0]:** Sets the scrolling amount of base image. The base image is scrolled in vertical direction and displayed from the line determined by VL[8:0]. Make sure that VL[8:0]  $\leq 320$ .

## 11. Window Address Function

The window address function enables writing display data consecutively in a rectangular area (a window address area) made on the internal RAM. The window address area is made by setting the horizontal address register (start: HSA[7:0], end: HEA[7:0] bits) and the vertical address register (start: VSA[8:0], end: VEA[8:0] bits). The AM bit sets the transition direction of RAM address (either increment or decrement). These bits enable the ILI9325 to write data including image data consecutively not taking data wrap positions into account.

The window address area must be made within the GRAM address map area. Also, the GRAM address bits (RAM address set register) must be an address within the window address area.

[Window address setting area]

(Horizontal direction)  $00H \leq HSA[7:0] \leq HEA[7:0] \leq "EF"H$

(Vertical direction)  $00H \leq VSA[8:0] \leq VEA[8:0] \leq "13F"H$

[RAM address, AD (an address within a window address area)]

(RAM address)  $HSA[7:0] \leq AD[7:0] \leq HEA[7:0]$

$VSA[8:0] \leq AD[15:8] \leq VEA[8:0]$

Window address setting area

HSA[7:0] = 10h, HSA[7:0] = 3Fh, I/D = 1 (increment)  
VSA[8:0] = 20h, VSA[8:0] = 4Fh, AM = 0 (horizontal writing)

## 12. Gamma Correction

ILI9325 incorporates the  $\gamma$ -correction function to display 262,144 colors for the LCD panel. The  $\gamma$ -correction is performed with 3 groups of registers determining eight reference grayscale levels, which are gradient adjustment, amplitude adjustment and fine-adjustment registers for positive and negative polarities, to make ILI9325 available with liquid crystal panels of various characteristics.

**Figure 36 Grayscale Voltage Generation**

Figure 37 Grayscale Voltage Adjustment

### 1. Gradient adjustment registers

The gradient adjustment registers are used to adjust the gradient of the curve representing the relationship between the grayscale and the grayscale reference voltage level. To adjust the gradient, the resistance values of variable resistors in the middle of the ladder resistor are adjusted by registers PRP0[2:0]/PRN0[2:0], PRP1[2:0]/PRN1[2:0]. The registers consist of positive and negative polarity registers, allowing asymmetric drive.

### 2. Amplitude adjustment registers

The amplitude adjustment registers, VRP0[3:0]/VRN0[3:0], VRP1[4:0]/VRN1[4:0], are used to adjust the amplitude of grayscale voltages. To adjust the amplitude, the resistance values of variable resistors at the top and bottom of the ladder resistor are adjusted. Same as the gradient registers, the amplitude adjustment registers consist of positive and negative polarity registers.

### 3. Fine adjustment registers

The fine adjustment registers are used to fine-adjust grayscale voltage levels. To fine-adjust grayscale voltage levels, fine adjustment registers adjust the reference voltage levels, 8 levels for each register generated from the ladder resistor, in respective 8-to-1 selectors. Same with other registers, the fine adjustment registers consist of positive and negative polarity registers.

**Figure 38 Gamma Curve Adjustment**

Register Groups	Positive Polarity	Negative Polarity	Description

	KP2 [2:0]	KN2 [2:0]	8-to-1 selector (voltage level of grayscale 20)
	KP3 [2:0]	KN3 [2:0]	8-to-1 selector (voltage level of grayscale 43)
	KP4 [2:0]	KN4 [2:0]	8-to-1 selector (voltage level of grayscale 55)
	KP5 [2:0]	KN5 [2:0]	8-to-1 selector (voltage level of grayscale 62)

### Ladder resistors and 8-to-1 selector Block configuration

The reference voltage generating block consists of two ladder resistor units including variable resistors and 8-to-1 selectors. Each 8-to-1 selector selects one of the 8 voltage levels generated from the ladder resistor unit to output as a grayscale reference voltage. Both variable resistors and 8-to-1 selectors are controlled according to the  $\gamma$ -correction registers. This unit has pins to connect a volume resistor externally to compensate differences in various characteristics of panels.

### Variable resistors

ILI9325 uses variable resistors of the following three purposes: gradient adjustment (VRCP(N)0/VRCP(N)1); amplitude adjustment (1) (VROP(N)0); and the amplitude adjustment (2) (VROP(N)1). The resistance values of these variable resistors are set by gradient adjustment registers and amplitude adjustment registers as follows.

Gradient adjustment		Amplitude adjustment (1)		Amplitude adjustment (2)	
PRP(N)0/1[2:0]	VRCP(N)0	VRP(N)0[3:0]	VROP(N)0	VRP(N)1[4:0]	VROP(N)1
Register	Resistance	Register	Resistance	Register	Resistance
000	0R	0000	0R	00000	0R
001	4R	0001	2R	00001	1R
010	8R	0010	4R	00010	2R
011	12R	:	:	:	:
100	16R	:	:	:	:
101	20R	1101	26R	11101	29R
110	24R	1111	28R	11110	30R
111	28R	1111	30R	11111	31R

### 8-to-1 selectors

The 8-to-1 selector selects one of eight voltage levels generated from the ladder resistor unit according to the fine adjustment register and output the selected voltage level as a reference grayscale voltage (VgP(N)1~6).

The table below shows the setting in the fine adjustment register and the selected voltage levels for respective reference grayscale voltages.

Fine adjustment registers and selected voltage

## **13. Application**

### **13.1. Configuration of Power Supply Circuit**

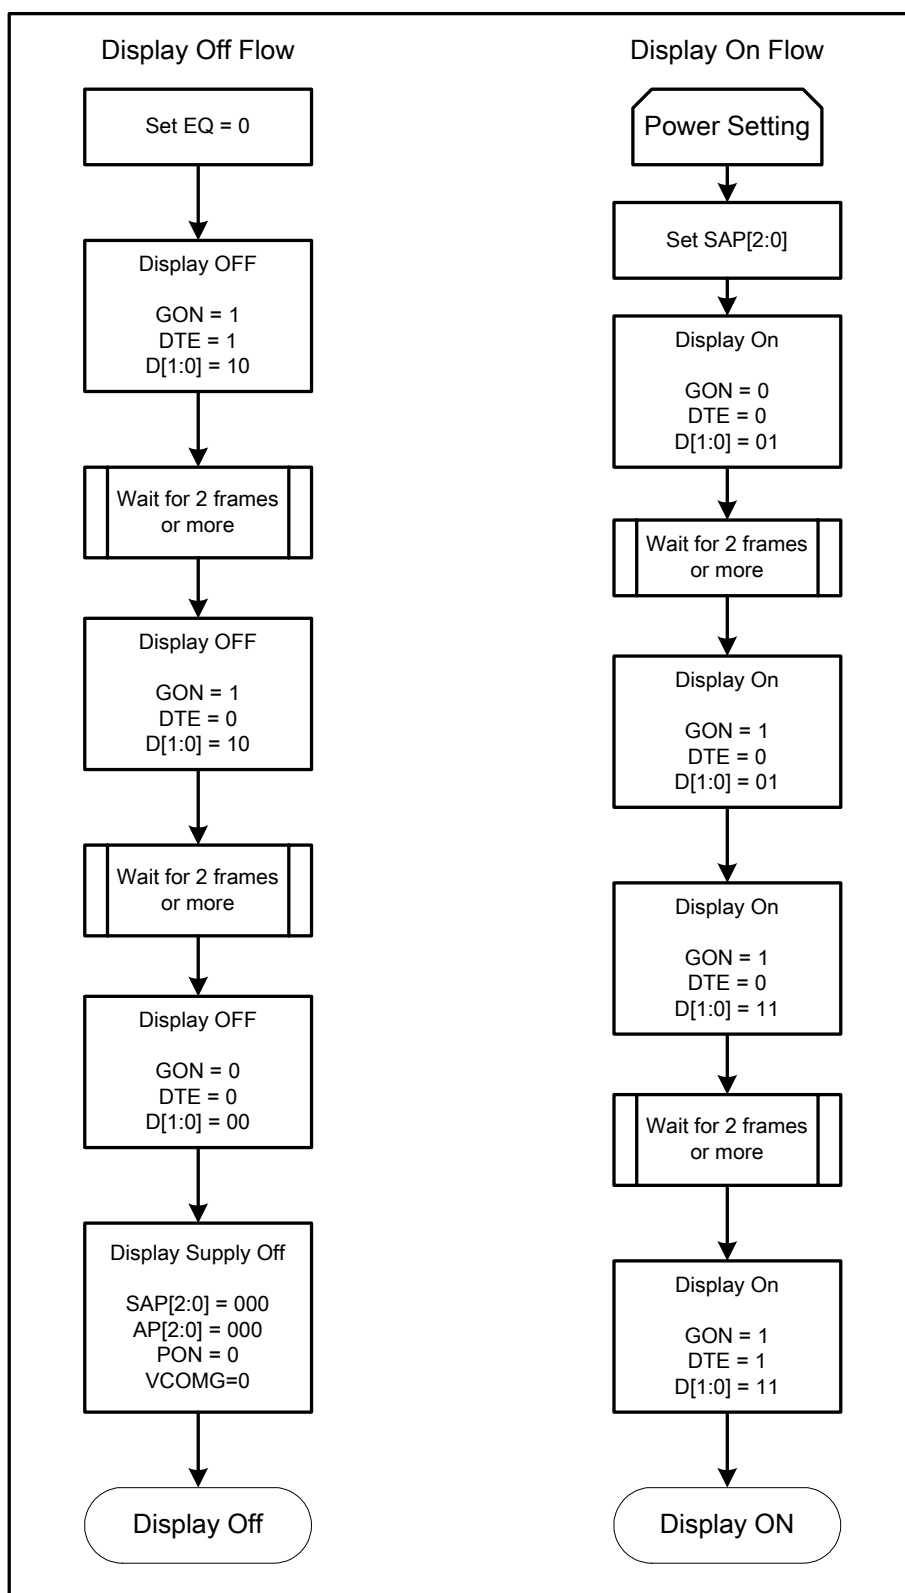

**Figure 41 Power Supply Circuit Block**

The following table shows specifications of external elements connected to the ILI9325's power supply circuit.

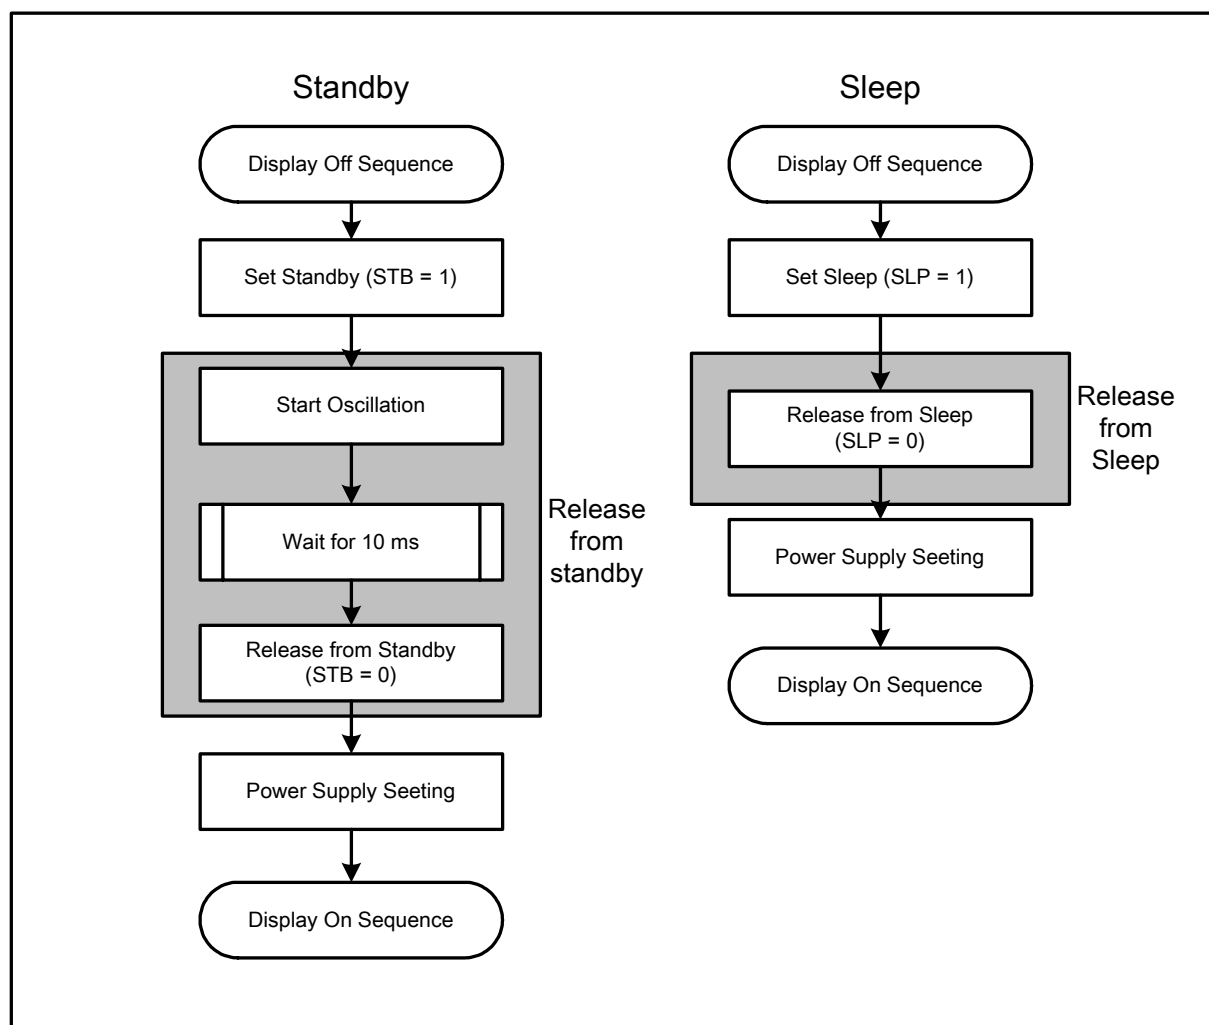

Items	Recommended Specification	Pin connection
<b>Capacity</b> 1 $\mu$ F (B characteristics)	6V	VREG1OUT, VCI1, VDD, VCL, VCOMH, VCOML, C11+/-, C12+/-
	10V	DDVDH, C21+/-, C22+/-
	25V	VGH, VGL
<b>Schottky diode</b>	$V_F < 0.4V/20mA$ at $25^\circ C$ , $V_R \geq 30V$ (Recommended diode: HSC226)	(AGND – VGL), (Vci – VGH), (Vci – DDVDH)
<b>Variable resistor</b>	$> 200\ k\Omega$	VCOMR

### 13.3. Standby and Sleep Mode

**Figure 43 Standby/Sleep Mode Register Setting Sequence**

## 13.4. Power Supply Configuration

When supplying and cutting off power, follow the sequence below. The setting time for oscillators, step-up circuits and operational amplifiers depends on external resistance and capacitance.

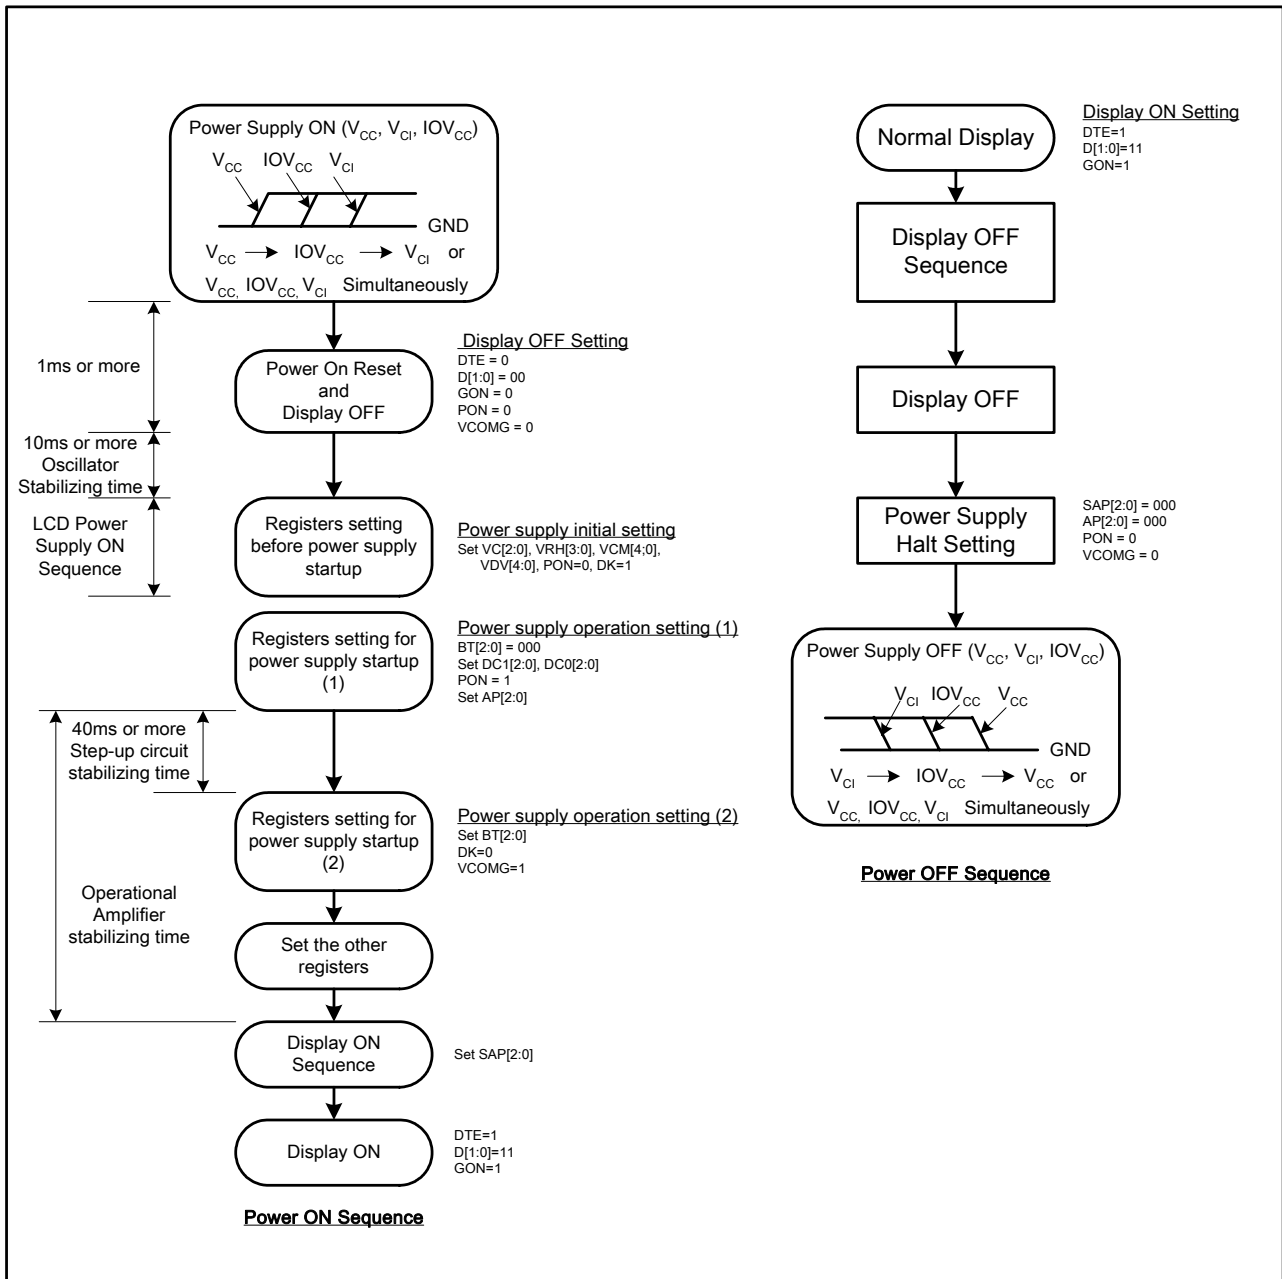

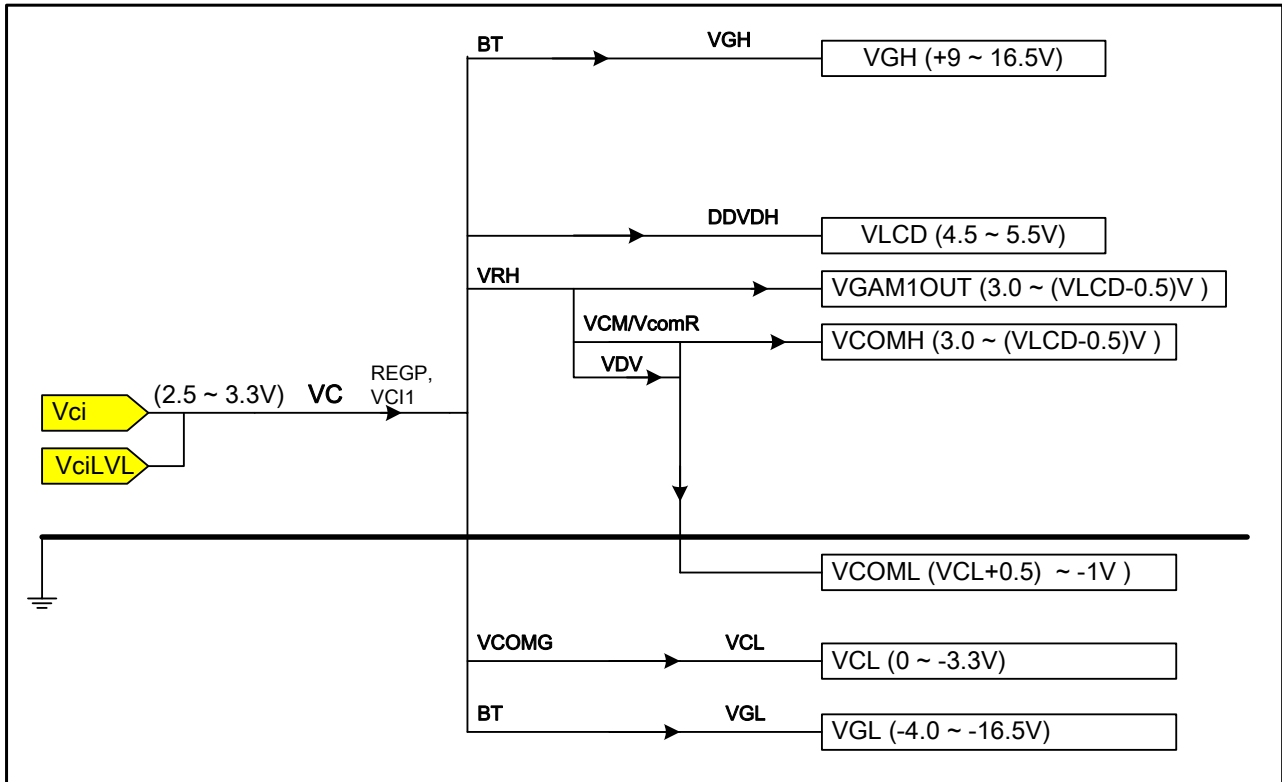

Figure 44 Power Supply ON/OFF Sequence

### 13.5. Voltage Generation

The pattern diagram for setting the voltages and the waveforms of the voltages of the ILI9325 are as follows.

**Figure 45 Voltage Configuration Diagram**

Note: The DDVDH, VGH, VGL, and VCL output voltage levels are lower than their theoretical levels (ideal voltage levels) due to current consumption at respective outputs. The voltage levels in the following relationships  $(DDVDH - VREG1OUT) > 0.5V$ ,  $(VCOML1 - VCL) > 0.5V$ ,  $(VCOML2 - VCL) > 0.5V$  are the actual voltage levels. When the alternating cycles of VCOM are set high (e.g. the polarity inverts every line cycle), current consumption is large. In this case, check the voltage before use.

## 13.7. Partial Display Function

The ILI9325 allows selectively driving two partial images on the screen at arbitrary positions set in the screen drive position registers.

The following example shows the setting for partial display function:

Base Image Display Setting	
BASEE	0
NL[5:0]	6'h27
Partial Image 1 Display Setting	
PTDE0	1
PTSA0[8:0]	9'h000
PTEA0[8:0]	9'h00F

PTSA1[8:0]	9'h020
PTEA1[8:0]	9'h02F
PTDP1[8:0]	9'h0C0

### 13.8. Resizing Function

ILI9325 supports resizing function (x1/2, x1/4), which is performed when writing image data to GRAM. The resizing function is enabled by setting a window address area and the RSZ bit which represents the resizing factor (x1/2, x1/4) of image. The resizing function allows the system to transfer the original-size image data into the GRAM with resized image data.

	1/2 (RSZ=2'h1)	1/4 (RSZ=2'h3)

The RSZ bit sets the resizing factor of an image. When setting a window address area in the internal GRAM, the GRAM window address area must fit the size of resized image. The following example show the resizing setting.

Original image data number in horizontal direction		X
Original image data number in Vertical direction		Y
Resizing Ration		1/N
Resizing Setting	RSZ	N-1
Remainder pixels in horizontal direction	RCH	H
Remainder pixels in vertical direction	RCV	V
GRAM writing start address	AD	(x0, y0)
GRAM window setting	HSA	x0
	HEA	x0+dx-1
	VSA	y0
	VEA	y0+dy-1

## 14. Electrical Characteristics

### 14.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When ILI9325 is used out of the absolute maximum ratings, the ILI9325 may be permanently damaged. To use the ILI9325 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the ILI9325 will malfunction and cause poor reliability.

Item	Symbol	Unit	Value	Note
Power supply voltage (1)	VCC, IOVCC	V	-0.3 ~ + 4.6	1, 2
Power supply voltage (1)	VCI - AGND	V	-0.3 ~ + 4.6	1, 4
Power supply voltage (1)	DDVDH - AGND	V	-0.3 ~ + 6.0	1, 4
Power supply voltage (1)	AGND - VCL	V	-0.3 ~ + 4.6	1
Power supply voltage (1)	DDVDH - VCL	V	-0.3 ~ + 9.0	1, 5
Power supply voltage (1)	VGH - AGND	V	-0.3 ~ + 18.5	1, 5
Power supply voltage (1)	AGND - VGL	V	-0.3 ~ + 18.5	1, 6
Input voltage	Vt	V	-0.3 ~ VCC+ 0.3	1
Operating temperature	Topr	°C	-40 ~ + 85	8, 9
Storage temperature	Tstg	°C	-55 ~ + 110	8, 9

Notes:

1. VCC,DGND must be maintained
2. (High) (VCC = VCC) ≥ DGND (Low), (High) IOVCC ≥ DGND (Low).
3. Make sure (High) VCI ≥ DGND (Low).
4. Make sure (High) DDVDH ≥ ASSD (Low).
5. Make sure (High) DDVDH ≥ VCL (Low).
6. Make sure (High) VGH ≥ ASSD (Low).
7. Make sure (High) ASSD ≥ VGL (Low).
8. For die and wafer products, specified up to 85°C.
9. This temperature specifications apply to the TCP package
